Welcome to Penn State and to the 92<sup>nd</sup> American Chemical Society Colloid & Surface Science Symposium! Penn State researchers engage in world-class research in colloidal and surface science, through many departments, as well as through our Materials Research Institute and our NSF MRSEC Center for Nanoscale Science. The Millennium Science Complex and other facilities house world-class facilities, with outstanding technical staff. So we welcome you here. As part of the Colloid & Surface Science family, we hope that you'll feel right at home.

We thank our sponsors for their generous support. And we welcome our exhibitors and encourage you to visit their tables in the Penn Stater Hotel. We are all part of this exciting research adventure.

We hope you enjoy our 3-day program, with a dozen topical sessions, including an exciting new session on "Connecting the Dots in Industry". We have more than 60 keynotes and 81 sessions, with contributions from around the globe.

So welcome to the Symposium, and to Penn State!

# Plenary Lecture 1

*Monday, June 11, 2018, 8:30 AM - 9:30 AM*

*Location: Presidents Hall*

- 8:30**     **1. PLENARY.**     Mechanically Assembled 3D Mesostructures as Scaffolds for Multifunctional Materials. **J. Rogers**; Northwestern University, Evanston, IL.

**ABSTRACT:** A rapidly expanding area of research in materials science focuses on the development of routes to complex functional materials that exploit engineered three dimensional (3D) architectures. This talk summarizes recently developed strategies in geometric transformation that allow for the spontaneous, guided assembly of 3D mesostructures from two dimensional (2D) precursors, where the characteristic feature sizes can span the entire mesoscopic range, from tens of nanometers to hundreds of microns and more. A goal is to create scalable capabilities for defining properties of materials systems not only through the chemical compositions and morphological characteristics of their constituents but also through well-defined, static or tunable 3D configurations. The resulting systems can be viewed as metamaterials, where engineered mesostructures lead to unique and important optical, thermal, acoustic, mechanical and electronic properties. This presentation includes a broad range of such examples.

**5:15 PM 339. PLENARY.** Direct nanoscopic imaging: from crystallizing of nanoparticles to crumpling of polymer films. **Q. Chen**; Materials Science and Engineering, University of Illinois, Urbana, IL.

ABSTRACT. The research in my group focuses on understanding the organization of complex materials and biological systems in space and time. In this talk, I will discuss two types of systems imaged using electron microscopy-based methods. The first type of systems concerns crystallization kinetics of a series of nanoparticle superlattices formed in solution. We monitor, for the first time, the initial nucleation of crystallites on the fly in real-time and real-space using low-dose liquid-phase transmission electron microscopy. Single-particle tracking, statistical mechanics-based analysis and Monte Carlo simulation reveal unexpected crystallization kinetics due to inherent many-body coupling and discreteness of building blocks at the nanoscale. In the second system, we investigate the crumpling of a polymer filtration membrane used for water desalination. Their

nanoscopic three-dimensional morphology has intricate indications on their performances, particularly solvent permeation and solute retention. Both systems serve to achieve our common goal of deciphering fundamental rules of organization from “seeing is believing”.

## Victor K. LaMer Award Lecture

*Wednesday, June 13, 2018, 8:30 AM - 9:30 AM*

*Location: Presidents Hall*

**8:30 340. PLENARY.** Engineered colloidal nanostructures for carrier and photon managements in solar energy conversion. **K. Wu;** Chinese Academy of Sciences, University Park, CHINA.

**ABSTRACT.** The nature of solar energy conversion is light-matter interaction. High conversion efficiencies can be achieved by managing solar photons in the sunlight and/or managing charge carriers in the matter. The optical and electronic properties of colloidal nanostructures can be controllably engineered using simple-yet-versatile synthesis, enabling an ideal platform for exploring the physical principles of photon and carrier managements. In this talk, I will cover our recent progress on both aspects. I will first introduce our efforts of carrier management using various colloidal semiconductor-semiconductor and semiconductor-metal nano heterostructures, with the general goal of facilitating charge separation and suppressing charge recombination. Efficient (near unity yield) and long-lived (microsecond timescale) charge separations have indeed been achieved through rational design of donor-acceptor-catalyst like heterostructures. In the second part, I will introduce the use of colloidal nanostructures in luminescent solar concentrators for advanced photon management. Specially-designed colloidal core/shell or doped nanocrystals can absorb solar photons, efficiently emit luminescence photons and guide them to the edges of a planar concentrator. This can potentially enhance the efficiencies of edge-attached photovoltaic (PV) cells, and meanwhile, decrease the cost of modern PV devices. In parallel with introducing the photon and carrier management concepts, I will also discuss the underpinning fundamental physics, such as light absorption and emission, charge transfer, and energy transfer, studied by a variety of steady-state and ultrafast time-resolved spectroscopic techniques.

# 2019 ACS CSSS Symposium

## 93<sup>rd</sup> COLLOID & SURFACE SCIENCE SYMPOSIUM

The 93rd Colloid & Surface Science Symposium of the American Chemical Society will continue a long tradition of bringing together academic and industrial researchers from across the globe to celebrate diverse experiences and common interests in colloidal systems, interfacial phenomena and soft matter topics.

We hope that you can join us from June 16<sup>th</sup> to 19<sup>th</sup>, 2019 at Georgia Tech for a memorable symposium.

***See you in Atlanta!***
